Protein folding is the physical process by which a protein chain acquires its native 3-dimensional structure, a conformation that is usually biologically functional, in an expeditious and reproducible manner. It is the physical process by which a polypeptide folds into its characteristic and functional three-dimensional structure from random coil. Each protein exists as an unfolded polypeptide ...

A molecular orbital diagram, or MO diagram, is a qualitative descriptive tool explaining chemical bonding in molecules in terms of molecular orbital theory in general and the linear combination of atomic orbitals (LCAO) method in particular. A fundamental principle of these theories is that as atoms bond to form molecules, a certain number of atomic orbitals combine to form the same number of ...

The C-terminal SBD of *A. niger* was prepared both by proteolysis and in recombinant form, and solution structures of the free and the β -cyclodextrin-complexed SBD were determined by NMR spectroscopy. SBD consists of eight β -strands organised in two β -sheets forming a twisted β -barrel structure. Two starch-binding sites, seen to accommodate the starch mimic β -cyclodextrin, are ...

Polymorphism in crystalline solids is defined as materials with the same chemical composition, different lattice structures and/or different molecular conformations , , . Pseudopolymorphism is a term that refers to crystalline forms with solvent molecules as an integral part of the structure , . In a supramolecular sense, polymorphism is the existence of more than one type of network ...
